

Verified credit data

19 US banks, 40 quarters, 105 fields each · 202 macro series · how every number was proved, and where the proof stops.

Sethuraman Accounting, Tax & Consulting · 2026-09-08 · the covering document for SATC-verified-credit-data.xlsx

VALUES DELIVERED 156,881	CHECKED AGAINST AN OUTSIDE DOCUMENT 137,424	DISAGREED 2	FILED PAGES PHOTOGRAPHED 760
------------------------------------	---	-----------------------	--

No value in this feed is calculated by our software. No ratios, no quarter-on-quarter changes, no scores. If a number is here, a bank or a government agency published it in that form, and this document shows you how to put your finger on where. The one figure we do work out is the size of each merger step in NOT COMPARABLE, which is a warning about the data rather than part of it.

How a number gets here, and how it gets checked

THE PRODUCTION PATH

The lower road touches a document nobody here controls.

That is what makes this evidence rather than a second opinion from the same source.

difference o

Every value takes the upper road. Every value with a citation is also walked down the lower one, against the bank's own filed Call Report as the regulator serves it. The two meet, or the row says so.

One number, traced all the way

Two, in fact. The first is on a bank this system had never seen until this week, so it shows the machinery working on something it was not tuned for. The second is one of the 2 numbers in 79,800 that does not agree, which is the more useful of the two.

Regions Bank, total assets, 30 June 2026

A bank added to the set this week. Nothing about the chain was changed to accommodate it.

1 · THE FIGURE, AS DELIVERED

Regions Bank, 2026-06-30, field ASSET — **159,787,000** thousands of dollars. It is in BANK DATA in the workbook and in `verified-data/bank-values.csv`; filter `cert = 12368`, `report_date = 2026-06-30`, field = ASSET. **This value was read back out of that file**, not re-fetched.

2 · THE CALL THAT PRODUCED IT

```
https://banks.data.fdic.gov/api/financials?filters=CERT%3A12368&fields=CERT,REPDT,ASSET&format=json
```

3 · WHAT HAPPENED IN BETWEEN

Nothing. The value is copied from the response into the file — no sum, no ratio, no restatement, no rounding. The workbook records how it was checked as: *read straight off the filing*.

4 · THE INDEPENDENT SOURCE

The bank's own Call Report for that quarter, as the FFIEC's Central Data Repository serves it — a facsimile, meaning an exact copy of the filled-in form rather than a database rendered to look like one. Schedule **RC 12**, the line carrying RCFD2170, in thousands of dollars.

```
https://cdr.ffiec.gov/Public/ViewFacsimileDirect.aspx?ds=call&idType=fdiccert&id=12368&date=06302026
```

Last Updated on 7/29/2026

FFIEC 031
Report Date 6/30/2026
17

Schedule RC - Balance Sheet(Form Type - 031)

All schedules are to be reported in thousands of dollars. Unless otherwise indicated, report the amount outstanding as of the last business day of the quarter.

Dollar amounts in thousands

12. Total assets (sum of items 1 through 11).....	RCFD2170	159,787,000	12.
---	----------	--------------------	-----

The filed page, and the row on it, **ringed in red**. The header is photographed from the same page, so “same entity, same date” is read off the picture rather than taken on trust.

5 · THE COMPARISON

ours (bank-values.csv, as delivered)	159,787,000
source (RCFD2170 on the filing)	159,787,000
difference	0

TIED. The delivered file and the filed form agree to the dollar.

Huntington National Bank, total risk-based capital, 31 March 2026

One of the two differences in the whole feed, and they are the same event twice. It is here on purpose: a tie-out that hides its own findings is worth nothing.

1 · THE FIGURE, AS DELIVERED

Huntington National Bank, 2026-03-31, field RBC — **29,147,082** thousands of dollars. It is in BANK DATA in the workbook and in `verified-data/bank-values.csv`; filter `cert = 6560`, `report_date = 2026-03-31`, field = RBC. **This value was read back out of that file**, not re-fetched.

2 · THE CALL THAT PRODUCED IT

```
https://banks.data.fdic.gov/api/financials?filters=CERT%3A6560&fields=CERT,REPDTE,RBC&format=json
```

3 · WHAT HAPPENED IN BETWEEN

Nothing. The value is copied from the response into the file — no sum, no ratio, no restatement, no rounding. The workbook records how it was checked as: *filed under 1 framework(s); this is the one that binds, chosen on its capital ratio*.

4 · THE INDEPENDENT SOURCE

The bank's own Call Report for that quarter, as the FFIEC's Central Data Repository serves it — a facsimile, meaning an exact copy of the filled-in form rather than a database rendered to look like one. Schedule **RC-R Pt I 3792**, the line carrying RCFA3792, in thousands of dollars.

```
https://cdr.ffiec.gov/Public/ViewFacsimileDirect.aspx?ds=call&idType=fdiccert&id=6560&date=03312026

32. Total assets (Schedule RC, item 12); (must be less than \$10 billion).....	RCFA2170	NR		32.
33. Trading assets and trading liabilities (Schedule RC, sum of items 5 and 15). Report as a	RCFAKX77	NR	RCFAKX78	NR 33.

a. Total capital (sum of items 26 and 46.a).....	RCFA3792	29,148,027	47.a.
--	----------	------------	-------

The filed page, and the row on it, **ringed in red**. The header is photographed from the same page, so “same entity, same date” is read off the picture rather than taken on trust.

5 · THE COMPARISON

ours (bank-values.csv, as delivered)	29,147,082
source (RCFA3792 on the filing)	29,148,027
difference	-945

DIFFERS. It is not adjusted, rounded away or hidden. Both figures are in the delivered row, with the link to the filing.

The filing was read twice — off the printed page above and off the machine-readable copy the regulator publishes beside it — and both say **29,148,027**. The filing’s own total capital ratio multiplied by its own risk-weighted assets comes to 29,148,047, so the form is internally consistent. The second column on that line reads NR, not reported, so there is no other column the FDIC’s figure could have come from. **We have no explanation for the \$945 thousand, and we are not going to invent one.** It is 0.003% of the figure and it sits in the quarter Huntington closed an acquisition.

The same quarter disagrees a second time, and it says more

This bank’s **total capital ratio** for the same quarter disagrees too: the FDIC publishes **14.092446%** and the filing reports **14.087700%**. Until 8 September 2026 it was reported as agreeing, because capital ratios were compared to within 0.005 of a percentage point and this gap is 0.00475 — just inside. Every other one of the 1,520 capital-ratio rows is within 0.00005, which is the rounding you get from a form that prints six decimals and a publisher that prints four. So the room was a hundred times what rounding needed, and exactly one value used it. The comparison is now 0.0001 and this row is reported for what it is.

Working the risk-weighted assets back out of each side is what makes it worth reading:

	total capital	risk-weighted assets	
FDIC	29,147,082	206,827,694	
the filing	29,148,027	206,904,227	
difference	-945	-76,533	
		(thousands of dollars)	
leverage ratio	FDIC 10.235659%	filing 10.235700%	unmoved

Two capital figures moved together and two did not. Total capital and risk-weighted assets differ; Tier 1 capital and average assets, which the leverage ratio is built from, agree to the rounding. *Two figures in that table are read off the form by hand rather than computed: the filing’s own risk-weighted assets, and the leverage ratio as the filing prints it. The feed carries neither — it has no risk-weighted-assets field, and the leverage row agrees, so there is no filed figure recorded beside it.* This is the shape of an amendment to the risk-weighting pages rather than a mistyped line, and it is the best evidence we have for the explanation we could not prove: this filing was amended 143 days after the quarter and the FDIC’s published figures have not moved with it. **Still not proven** — the pre-amendment filing cannot be obtained. The FDIC’s risk-weighted assets are worked out here, from its own capital and its own ratio; they are not part of the data.

The roster, with its denominator

What did not check out comes first, because the things that agree are not what anybody needs to read.

Verdict	Rows	What it means
DIFFERS	2	the delivered value and the filed line do not agree; named above
not comparable — spans a merger	496	a quarterly flow in a quarter that mixes two banks. 33 such quarters in ten years, all listed in the workbook
not comparable — base moved	8	the quarter after a merger that landed in a first quarter: the running total it counts from is the FDIC's own adjusted figure, which no filing carries
not on that filing	114	the FORM did not carry that line in that quarter, so no bank filed it. Every one of these is the second half of 2016, before Schedule RC-N gained a total line, across all nineteen banks
computed by the FDIC	7,600	a figure the FDIC works out rather than a line a bank files. The lines it is worked out FROM are checked
macro, no obtainable source	11,237	whole series with no independent publisher we can reach; each row says why
TIED	137,424	checked against a document published by somebody outside this firm

And the thing every other check takes on trust

Everything above proves the FDIC agrees with a filing *for a given certificate*. None of it proves the certificate is the bank whose name we print beside it — a wrong certificate ties perfectly against itself. So each one was checked against the legal name printed on that bank's own filed front page: **19 of 19**.

That check exists because searching the regulator for a holding company's name does not fail cleanly. It word-matches. “PNC Financial” returns PlainsCapital Bank of University Park, Texas — a real, live, unrelated bank that would have tied to the dollar under the wrong label.

A certificate is stable; the institution behind it is not. Checked at the other end of the ten years as well: **16 of 19** carry the same legal name on the oldest filing as on the newest. The exceptions are **Truist Bank**, filed in 2016 as BRANCH BANKING AND TRUST COMPANY; **Fifth Third Bank NA**, filed in 2016 as FIFTH THIRD BANK; **Zions Bancorporation NA**, filed in 2016 as ZB, NATIONAL ASSOCIATION. All but one are a new name over the same institution — Zions dropping the initials it traded under, Fifth Third converting its charter. **Truist is not:** everything before December 2019 under that label is Branch Banking and Trust, which is half the bank that carries the name afterwards.

And the hop between the check and this file

Each verifier compares against the filed document a value it holds in memory; the delivered files are written afterwards. That last hop was described and never executed — so on 7 September 2026 it was: every delivered value was compared with the value its verifier actually held. **156,881 of 156,881**

identical, none moved, none unchecked. Rerun it with `tools/tieout/prove_delivered_is_what_was_checked.py`.

Check any number yourself, in about a minute

No account, no login. This is a public record.

1. Open `BANK DATA` in the workbook and find a row. Note two columns: `cited_line` and `filing_url`.
2. Open the `filing_url`. For the Regions Bank figure above that is:

```
https://cdr.ffiec.gov/Public/ViewFacsimileDirect.aspx?ds=call&idType=fdiccert&id=12368&date=06302026
```

3. Search that page for the `cited_line` code — `RCFD2170` in this case. The number printed beside it is the number in the workbook.

That code is an **MDRM code**: the Federal Reserve's permanent identifier for one line on one schedule of the form. It does not change when the form is re-laid-out, and quoting one to a bank's finance team tells them exactly which number you mean.

When the row cites more than one line

24,568 of the 79,800 bank rows cite a single line, and the three steps above are all of it. The rest need one more thing, and the row says which in its note.

- **38,671 rows add or subtract two or more lines.** The `cited_line` is that arithmetic — find each code on the page and do what the signs say. No one number printed on the filing is the number in the workbook.
- **8,961 rows are one quarter of a running yearly total**, which no filing carries on its own: it is this filing's year-to-date less the previous one's. So you need the quarter before as well, and it is at a different address — change the date in the link to the previous quarter end.
- **7,600 rows are figures the FDIC works out** rather than lines a bank files. There is nothing on the form to find; where they are worked out FROM lines, those lines are in this feed and are checked.

To change bank or quarter, edit the `id` (the FDIC certificate) and the `date` (`MMDDYYYY`, a quarter end) in that address.

What running this found

209 exhibits sit behind this feed — one per bank per year, 945 MB of them, every cited row photographed off the filed page with the page header in the shot. They are kept locally rather than sent with this document. Building them is what turned up the following, none of which any test caught.

- **Nine values were right and their citations were wrong.** Total loans and leases matched to within exactly one thousand dollars across three unrelated banks. The FDIC publishes that total as

the sum of two separately-rounded halves; our citation pointed at the bank's own single-line total. Both numbers were correct as published, and only following the citation to the page could show it.

- **33 quarters in ten years span a merger**, where a first pass over sixteen quarters had seen six. Every one of them would otherwise have been reported as the regulator disagreeing with the filings when nothing was wrong with either.
- **The largest acquisition in the set was filed under a code we did not carry.** First-Citizens taking on Silicon Valley Bridge Bank in March 2023 is recorded by the FDIC as a “Bridge Bank Resolution”. Our merger list works by naming what counts rather than naming what does not, so it reported the code as unrecognised instead of silently treating it as ordinary trading.
- **The quarter after a first-quarter merger cannot be formed from the filings at all.** A quarterly flow is the year's running total less what was already reported — and the first quarter's published figure is that base. Where a merger moves it, nothing in the documents reaches the second quarter. Eight values are reported as such rather than as differences.
- **Nineteen fields were shipping with no units beside them.** A number in a spreadsheet with no unit is the trap this whole feed is written against, and it was in the feed.
- **The exhibits for seven banks were built with no photographs in them** and rendered perfectly. The pictures had been cut into one folder and read from another. The builder now refuses to finish a document that carries values and no pictures.

Every one of those was found by pointing the machinery at banks it had never seen, and by opening what came out. That is the argument for doing this again next quarter rather than assuming it still works.

What I got wrong

The last version of this document got these wrong. None of them was a value — every number in the feed was checked again and not one moved — and every one is the same mistake: something true on the day it was typed, still sitting there after the thing it described changed.

- **The roster printed 0 where 114 belonged.** One verdict was reworded on 8 September — it used to say the bank had not reported a line, which blamed the bank for something the form did not ask. The tally underneath was still looking for the old wording, found none, and printed nothing. So the front of this document said 156,881 values and the roster below it added to 156,767. Both were built from the same file. Now every value is sorted into exactly one row of that roster, so it adds up or the document does not get built.
- **It said eight of 87 fields are worked out by the FDIC.** There are 105 fields and ten of them. Both of those were right once. They are counted off the delivered file now, every time this is built.
- **Two lists in this document counted the same thing differently.** One said 6,080 rows are worked out by the FDIC and the roster said 7,600. The list under “when the row cites more than one line” sorted rows by what their citation looked like rather than by what the row says it is. Two fields the FDIC works out from averages of its own have no code to cite, so they fell in with the rows that need arithmetic — and 1,520 rows were told to find codes on a page that does not carry any. Both lists are sorted the same way now.

- **The filed pages were photographed and nothing on them was marked.** You were handed a picture of a dense regulatory page and a sentence saying which row to look at. The row is ringed in red now, which is the difference between checking us and taking our word for it.

What this does not prove

Read this one before you chart a bank across a merger. Every value here is correct for the institution as it stood that day — and on either side of a merger that institution is a different size, under the same name. **15 of the 31 merger quarters whose step can be measured move total assets by 10% or more, the largest being Truist Bank at 2019-12-31, +101%.** No single value is wrong, so no value-level check can catch it: it is a property of the SERIES, not of any number in it. NOT COMPARABLE in the workbook carries the size of every merger step, per bank, per quarter — and only those. A balance sheet can move that far without a merger and nothing here flags it: the largest single-quarter step in this feed is Morgan Stanley Bank NA at 2026-03-31, +54.5% of total assets, with nothing acquired.

- **Not that the banks are right.** A value can match its filing exactly and the filing can still be wrong. This proves faithful copying.
- **It is a snapshot, and banks amend.** Every bank row carries `filing_last_updated`, the date printed on the filing it was checked against, so you can see which version you have. Amendments are the normal case here rather than the exception: 442 of the 760 filings were last updated more than 90 days after the quarter they report and 289 more than a year after it — Bank of America amended its third quarter of 2016 in December 2021. The macro side has no such stamp.
- **2,964 of the 7,600 values the FDIC works out are checked; the rest are not.** Ten of the 105 fields are not lines a bank files — the FDIC works them out, so there is no row on any form to compare them with. Four of those ten are plain ratios of two figures this feed already carries and has already tied to the filings, and working each one out again from its own checked parts gives **2,964 of 2,964 agreeing, none differing.** The other six are built on averages the FDIC makes itself, or on figures this feed does not hold, so they stay unchecked. Run `tools/tieout/check_fdic_ratios.py`.
- **11,237 macro observations have no obtainable source.** They are whole series rather than a scatter of gaps, and most are Case-Shiller, whose history S&P Dow Jones Indices sells. The most recent month of all 22 of those WAS checked against the S&P free release and all 22 agreed — for 21 that pins the month-on-month move rather than the level, and for the national index it is a published level. Each row says exactly what was and was not checked.
- **The 19 banks are not a like-for-like peer group.** Bank of New York Mellon, Goldman Sachs Bank USA, Morgan Stanley Bank NA are not commercial lenders. Their balance sheets are shaped nothing like a lender's and a peer ranking that mixes them will mislead; they are marked `group = counterparty` in the peer list.
- **Nothing here was checked by a second person.**

What is in the workbook

Tab	What it is
