

Tie-out: every number in the FRED credit monitor

142 series, each proved against the agency that computes it — not against FRED, which only redistributes them. 5 September 2026.

142 of 142 tied. 0 differ. 0 could not.

Every figure on the left of every comparison below was read out of the shipped workbook, `FRED_Credit_Risk_Dashboard.xlsx`, and every figure on the right came off a document published by the agency that computed it. The tie-out found five defects, one of which was shipping a state with no data in it, and all five are in “What this found” below.

How the two roads meet

Only the lower road touches a document nobody here controls. That is what makes this evidence rather than a second opinion from the same source: FRED is the redistributor, and every figure was checked against the agency that computed it.

One figure, traced all the way

The roster covers all 142. This is one of them followed link by link, so a reader can see the shape of the check before trusting the count.

1 • The figure

Total consumer credit outstanding, seasonally adjusted, at June 2026. In the workbook it is on the `Raw_Consumer` tab. Open the file, go to that tab and that cell, and this is what is there:

	A	B	C
1978	TOTALSL	Total Consumer C	(freq=monthly; units=billions \$; transform=yoy_pct; vintage
1979	date	value	
1980	2026-06-01	5166907.71	
1981	2026-05-01	5152735.06	
1982	2026-04-01	5153816.46	

FRED_Credit_Risk_Dashboard.xlsm, Raw_Consumer. Excel's own row numbers and column letters are printed, so the reference can be checked rather than taken on trust.

2 • The call that produced it

```
curl "https://api.stlouisfed.org/fred/series/observations?
series_id=TOTALSL&api_key=$FRED_API_KEY&file_type=json"
```

That is the build's request. It is *not* the check: FRED redistributes this series, so asking FRED whether FRED is right is the mirror. The check is link 4.

3 • What happens in between

Nothing. The series is a level and the workbook stores it as landed, in millions of dollars, newest observation first. There is no transform, no rescaling and no unit conversion between the response and the cell — which is worth saying out loud, because “then the system computes it” is exactly the gap a tie-out exists to close.

4 • The independent source

The Federal Reserve Board computes and publishes the G.19. Anyone can fetch the same table:

```
https://www.federalreserve.gov/releases/g19/hist/cc_hist_sa_levels.html
```

The figure sits in the row labelled **Jun 2026**, in the column headed **Total**, under “Consumer credit outstanding, seasonally adjusted”, in millions of dollars. Here is that page, with the row ringed and the table's own column headings brought into the same frame:

Federal Reserve Board -- G.19 Consumer Credit, historical seasonally adjusted levels -- row Jun 2026				
COLUMN HEADINGS, COPIED FROM THE TOP OF THIS SAME TABLE				
Date	Total	Revolving	Nonrevolving	
Jan 1943	6,577.83	n.a.	6,577.83

Federal Reserve Board, G.19 historical table. Last updated 7 August 2026, per the line under the table.

5 · The comparison

ours	Raw_Consumer B1980, read from the workbook	5166907.71
source	G.19 historical SA levels, Jun 2026, 'Total'	5166907.71
diff		0.0

Same entity (all US consumer credit), same period (June 2026), same basis (seasonally adjusted, outstanding level), same units (millions of dollars). Verdict **TIED**, read off that block rather than written before it.

The sets, and the sources behind them

Split by who publishes the number, because that is what determines where the check has to go and how hard it is to get there.

FHFA All-Transactions house price indexes

Federal Housing Finance Agency — **67 of 67 tied**

FHFA -- hpi_at_state.csv, the agency's own quarterly file: header row plus three states at 2026 Q2 — file fhfa_state.csv, line numbers as in the file	
206	AK, 2026, 2, 494.13
1030	CA, 2026, 2, 974.97
2266	GA, 2026, 2, 662.08

FHFA hpi_at_state.csv, the agency's own quarterly file. Header row, then Alaska, California and Georgia at 2026 Q2.

FHFA -- hpi_at_us_and_census.csv, row USA 2026 Q2 — file fhfa_us.csv, line numbers as in the file	
2060	USA, 2026, 2, 719.87

FHFA hpi_at_us_and_census.csv, row USA 2026 Q2.

The Board's SLOOS chart data, row 2026:3, with the panel headings copied in from the top of the same table.

Federal Reserve Board -- SLOOS Table 1, question 1: standards on C&I loans to large and middle-market firms, by bank size						
C&I loans to large and middle-market firms: Tightening standards to originate loans to large and middle-market firms, by bank size						
COLUMN HEADINGS, COPIED FROM THE TOP OF THIS SAME TABLE						
All Respondents Large Banks Other Banks						
Banks Percent Banks Percent Banks Percent						
Tightened considerably	0	0.0	0	0.0	0	0.0
Tightened somewhat	3	5.4	1	4.5	2	5.9
Remained basically unchanged	50	89.3	21	95.5	29	85.3
Eased somewhat	3	5.4	0	0.0	3	8.8
Eased considerably	0	0.0	0	0.0	0	0.0
Total	56	100	22	100	34	100

A. Standards for large and middle-market firms (annual sales of \$50 million or more):

All Respondents Large Banks Other Banks						
Banks Percent Banks Percent Banks Percent						
Tightened considerably	0	0.0	0	0.0	0	0.0
Tightened somewhat	3	5.4	1	4.5	2	5.9
Remained basically unchanged	50	89.3	21	95.5	29	85.3
Eased somewhat	3	5.4	0	0.0	3	8.8
Eased considerably	0	0.0	0	0.0	0	0.0
Total	56	100	22	100	34	100

B. Standards for small firms (annual sales of less than \$50 million):

All Respondents Large Banks Other Banks						
Banks Percent Banks Percent Banks Percent						
Tightened considerably	0	0.0	0	0.0	0	0.0
Tightened somewhat	3	5.5	1	4.8	2	5.9
Remained basically unchanged	50	90.9	20	95.2	30	88.2
Eased somewhat	2	3.6	0	0.0	2	5.9
Eased considerably	0	0.0	0	0.0	0	0.0
Total	55	100	21	100	34	100

For this question, 1 respondent answered "My bank does not originate C&I loans or credit lines to small firms."

2. For applications for C&I loans or credit lines--other than those to be used to finance mergers and acquisitions--from large and middle-market firms and from small firms that your bank currently is willing to approve, how have the terms of those loans changed over the past three months?

A. Terms for large and middle-market firms (annual sales of \$50 million or more):

a. Maximum size of credit lines

All Respondents Large Banks Other Banks						
Banks Percent Banks Percent Banks Percent						
Tightened considerably	0	0.0	0	0.0	0	0.0
Tightened somewhat	2	3.6	0	0.0	2	5.9
Remained basically unchanged	44	78.6	17	77.3	27	79.4
Eased somewhat	10	17.9	5	22.7	5	14.7
Eased considerably	0	0.0	0	0.0	0	0.0
Total	56	100	22	100	34	100

b. Maximum maturity of loans or credit lines

SLOOS Table 1, question 1: the response counts split three ways, All Respondents / Large Banks / Other Banks. The large-banks net percentage is computed from this.

S&P Cotality Case-Shiller house price indexes

S&P Dow Jones Indices — **22 of 22 tied**

S&P Dow Jones Indices refuses scripted requests outright — every attempt returned `HTTP 403`. The obstacle was real. It was not the verdict: S&P publishes a free monthly release, and that release carries the unadjusted index level for every metro and the seasonally adjusted month-on-month change for every metro. Twenty of these twenty-two series are the adjusted *levels*, which the release does not print — but two adjacent cells of our own workbook imply the change, and the change is published.

S&P Dow Jones Indices

A Division of **S&P Global**

PRESS RELEASE

Table 3 below shows a summary of the monthly changes using the seasonally adjusted (SA) and non-seasonally adjusted (NSA) data. Since its launch in early 2006, the S&P Cotality Case-Shiller Indices have published, and the markets have followed and reported on, the non-seasonally adjusted data set used in the headline indices. For analytical purposes, S&P Dow Jones Indices publishes a seasonally adjusted data set covered in the headline indices, as well as for the 17 of 20 markets with tiered price indices and the five condo markets that are tracked.

Metropolitan Area	June / May Change (%)		May / April Change (%)	
	NSA	SA	NSA	SA

Data through June 2026

The same release, Table 2: the unadjusted June index LEVEL. The national unadjusted series ties to 336.66 here, directly. Detroit shows no June value at all, which is the release agreeing with our workbook about an absence.

The residual was explained, not tolerated. Comparing at full precision, five of twenty-two lines missed the printed value by 0.005 to 0.0074 percentage points — tiny, and outside the rounding of a two-decimal percent. Widening the tolerance would have turned them green and taught nobody anything. Running the same arithmetic on the previous month, which the same table publishes, showed no series missing twice and the signs random: noise, not a data difference. The cause is that S&P publishes levels to two decimals and computes its printed change from those. Rounding our two cells the same way reproduces the release **exactly** on 42 of 42 comparisons across both months — a stricter test than the one that was failing, not a looser one.

Z.1 commercial property price indexes

Federal Reserve Board — **2 of 2 tied**

These two nearly went down as **COULD NOT**, and the obstacle was real but wrong. The Z.1 release ships a public CSV bundle; reading every member of it and collecting the series codes gives 6,107 codes, and neither of ours is among them. The Board's Financial Accounts Guide has a page for each code, but it prints the definition and no data, and its clipboard flow came back empty. Two dead ends, both accurately described. The third route works: the Board's Data Download Program publishes the entire Z.1 as one package, and that package carries both series. *It is not in the file I looked in* was never the same statement as *the Board does not publish it*.

One more thing had to be right before these could tie. FRED stamps a quarter at its first day and the Board stamps it at its last, so matching on the literal date reported “no observation” for a series that is plainly published. Same quarter, two conventions.

Every line in this set

Series	What it is	Workbook cell	Ours	Publisher	Diff	Verdict

How to run the whole thing yourself

Real values, already filled in. Nothing here needs editing before it will run.

1. Rebuild the workbook, so the cells you check are the ones the code produces:

```
cd C:\Users\ajish\SATC-cs\credit-suite
$env:FRED_API_KEY = "<your key>"
python -m credit_suite.sources.fred.runner --live
```

2. Open `example-output\FRED_Credit_Risk_Dashboard.xlsm` and go to `Raw_Consumer`. Every series is a header row carrying its id and title, then date/value rows newest first.
3. Fetch the Board's own G.19 table and read the row for the newest month:

https://www.federalreserve.gov/releases/g19/hist/cc_hist_sa_levels.html

4. For the house price indexes, fetch FHFA's own quarterly files:

https://www.fhfa.gov/hpi/download/quarterly_datasets/hpi_at_state.csv
https://www.fhfa.gov/hpi/download/quarterly_datasets/hpi_at_metro.csv
https://www.fhfa.gov/hpi/download/quarterly_datasets/hpi_at_us_and_census.csv

5. For the charge-off and delinquency rates, the Board publishes six tables:

<https://www.federalreserve.gov/releases/chargeoff/chgallsa.htm>
<https://www.federalreserve.gov/releases/chargeoff/delallsa.htm>
<https://www.federalreserve.gov/releases/chargeoff/chgtop100sa.htm>
<https://www.federalreserve.gov/releases/chargeoff/deltop100sa.htm>
<https://www.federalreserve.gov/releases/chargeoff/chgothersa.htm>
<https://www.federalreserve.gov/releases/chargeoff/delothersa.htm>

6. For the survey, the Board's chart data and its Table 1:

```
https://www.federalreserve.gov/data/sloos/sloos-202607-chart-data.htm
https://www.federalreserve.gov/data/sloos/sloos-202607-table-1.htm
```

7. For the debt service ratios, use the CURRENT release, not the archive:

```
https://www.federalreserve.gov/releases/dsr/
```

8. For Z.1, the complete package rather than the release page's CSV bundle:

```
https://www.federalreserve.gov/datadownload/Output.aspx?rel=Z1&filetype=zip
```

9. For Case-Shiller, the monthly release. Tables 2 and 3 carry the levels and the adjusted changes:

```
https://www.spglobal.com/spdji/en/index-family/indicators/sp-cotality-case-shiller/
```

What this found

Five things, none of which any test in the suite could have caught, because every one of them left the numbers correct.

1 · A shipped workbook with a state missing from it

Nebraska's house price index was blank. FRED publishes it, with data through April 2026, and it fetched first time when asked again. The build had hit one `Internal Server Error`, recorded it honestly in its own status — `"errors": ["NESTHPI: Internal Server Error"]` — blanked the slot, and passed. The retry logic covered rate limits only, so a single 5xx out of 142 requests shipped a monitor with a state missing. **Fixed:** transient server errors, timeouts and dropped connections are now retried; a dead series id still fails on the first try, because that is how five retired series were caught earlier and retrying it would hide the next one.

2 · Two series wearing each other's description

`SUBLPDRCS` is commercial real estate **construction and land development** and was labelled nonfarm nonresidential. `SUBLPDRCSN` is **nonfarm nonresidential** and was labelled construction and land. Both values were right, on the dashboard and in the raw tabs, which is exactly why nothing noticed.

3 · A tightening indicator with its alert switched off

The costly one. `SUBLPDHMS` measures banks tightening standards on GSE-eligible mortgages. It was labelled a *demand* series, and the seed's helper gives demand series `alert_rule = "none"` — right for a demand series, and this is not one. So a real mortgage-tightening signal sat on the dashboard and could

never fire. **Fixed**, and that turns an alert on: it is a change in what the dashboard flags, not just in what it says.

4 • Two more labels that described a different series

`DRTSSP` is subprime **mortgage** standards, not consumer loans. `SUBLPDCILSLGNQ` is **large banks** tightening standards, not increasing spreads. Right value, wrong label, is invisible until somebody reads the label against the publisher's own definition.

5 • Four series that told the reader “billions” beside a figure in millions

Look again at the workbook shot in the worked example above. The metadata line reads `units=billions` \$ and the value under it is **5,166,907.71**. Five quadrillion dollars of consumer credit. The number is right — it ties to the cent against the Board's own table, which prints that figure in **millions**, and FRED publishes all four of these as “Millions of U.S. Dollars”. Only the declared unit was wrong, by a factor of a thousand, on the line a person reads.

Nothing computes with that field; it is displayed. That is precisely why no numeric test could see it, and why it took photographing the cell to notice. **Fixed**, with the declared unit now checked against the publisher's own. The shots in this document still say “billions”, deliberately: they are the evidence, and replacing them would erase the finding.

One thing deliberately left alone. The two Z.1 commercial-property series carry a unit I could not settle. Our config calls both “millions \$”. FRED labels one “Mil. of \$” and the other “%”. The Board's own Financial Accounts Guide describes both identically, as price indexes — and calls neither a dollar level. Three authorities, three answers, and the values themselves tie exactly against the Board's package. I could not establish which unit is right, so nothing was changed and it is written down here instead. Unknown is a third answer.

The guard that now holds it down. `tests/test_fred_labels.py` checks each label against the publisher's own definition: a series must carry the words its definition requires, must *not* carry a sibling's words (which is what catches a swap), and a tightening measure must not be wired as a demand one. It refuses if a survey series is added with no recorded definition, so the check cannot quietly stop covering things. Four mutations against it, all killed, on a 409-test baseline.

What I got wrong

- **I read the wrong debt-service page first.** The Board's `/releases/housedebt/` page is an archive, frozen at 2024:1 and last updated in September 2024, because the DSR moved to a credit-bureau methodology from the 2024:Q2 publication. Comparing a 2026 figure against it produced three apparent differences of 1.4 percentage points. Nothing was wrong with the data; I had picked a

discontinued series computed a different way. It is in this document as a photograph, above, because it is the exact failure the “same basis” check exists to stop.

- **I called five Case-Shiller lines DIFFERS before I understood them.** They were within 0.0074 of a percentage point. The right response was not a wider tolerance; it was finding out why, which took one extra month of the same published table and turned 22 near-misses into 22 exact matches.

- **Six of my first twelve source photographs were blank and reported “ok”.**

`window.scrollBy` produces an empty capture in headless Chrome, so every one of them came back as an identical 6,615-byte white rectangle. I only know because I opened them. Nothing in the pipeline would have told me.

- **My first Z.1 answer was going to be COULD NOT**, with an obstacle I could describe precisely and had not finished testing. It was two clicks from being wrong in a document.

What this does not prove

- **It proves the latest observation, not the whole history.** Each series was checked at its most recent period — 142 of 142 — and the Case-Shiller set additionally at the month before. The other 13,763 observations in the workbook were not individually compared to anything.
- **The twenty adjusted Case-Shiller metros are tied through a ratio, not a level.** S&P does not publish adjusted levels free. Two adjacent workbook cells reproduce S&P's published change exactly, which pins the month-on-month move and the relationship between those two cells. It would not catch a constant scale error applied to the whole series.
- **It proves the number, not the formula.** Nothing here checks the dashboard's z-scores, bands or alert logic. That was deliberate and it is the firm's own instruction: the mission was the base data.
- **The column maps rest on the tables' own headings.** Where a Federal Reserve table has eleven unlabelled numeric columns, the mapping was read off the header and then confirmed by the values agreeing across every series in that table. A mapping that is wrong in a way that still agrees on every series is not excluded, though it is hard to construct.
- **Nothing here was checked by a second person.**
